

Gladiusite**Fe³⁺₂Fe²⁺₄(PO₄)₁₁·H₂O**

Crystal Data: Monoclinic. *Point Group:* 2/m. As arrow-headed crystals with stubby curved faces in radial clusters <2 mm in diameter, and as acicular crystals to 500 μm in aggregates.
Twinnings: Extensive, pseudo-orthorhombic revealed by structure analysis.

Physical Properties: *Cleavage:* None. *Fracture:* Uneven. *Tenacity:* Brittle. Hardness = 4-4.5 VHN (dense aggregate) = 280-320, 300 average (20 g load). D(meas.) = 3.11(2) D(calc.) = 3.08 Nonfluorescent. Slowly soluble in HCl.

Optical Properties: Translucent in thin needles, opaque in aggregates. *Color:* Dark green, almost black. *Streak:* Olive-green, (in 10-12 hours, changes to brownish red). *Luster:* Vitreous.
Optical Class: Biaxial (-). $\alpha = 1.722(2)$ $\beta = 1.730(2)$ $\gamma = 1.737(2)$ 2V(calc.) = 86°
Orientation: $c \parallel Z$. *Pleochroism:* Strong; X = olive-green, Y = grayish blue, Z = dark green with a blue tint. *Absorption:* X > Y > Z.

Cell Data: *Space Group:* P2₁/n. $a = 16.950(2)$ $b = 11.650(1)$ $c = 6.2660(6)$ $\beta = 90.000(4)^\circ$ $Z = 4$

X-ray Powder Pattern: Kovdor alkaline-ultramafic complex, Kola Peninsula, Russia.
4.805 (100), 5.83 (89), 3.533 (84), 6.87 (77), 2.868 (66), 3.787 (62), 9.61 (53)

Chemistry:	(1)
MgO	11.16
MnO	0.78
FeO	25.00
Fe ₂ O ₃	29.90
P ₂ O ₅	12.46
TiO ₂	0.04
H ₂ O	[20.18]
Total	99.51

(1) Kovdor complex, Kola Peninsula, Russia; average electron microprobe analysis, H₂O calculated (the Penfield method gave 19.7 wt. %), FeO/Fe₂O₃ partitioned by Mössbauer spectroscopy; corresponding to $\text{Fe}^{3+}_{2.00}(\text{Fe}^{2+}_{2.02}\text{Mg}_{1.61}\text{Fe}^{3+}_{0.17}\text{Mn}^{2+}_{0.06})_{\Sigma=3.86}(\text{P}_{1.02}\text{O}_4)(\text{OH})_{11.0}\cdot\text{H}_2\text{O}$.

Occurrence: A rare (only a few hundred mg are known to exist) low-temperature hydrothermal mineral in vugs in veins of dolomitic carbonatite.

Association: Pyrite, rutile, a ternovite-like mineral, catapleiite, rimkorolgite, bobierrite, collinsite, juonniite, strontiowhitlockite, pyrrhotite.

Distribution: From the Kovdor alkaline-ultramafic complex, Kola Peninsula, Russia.

Name: Alludes to the crystal morphology, which resembles a double-edged sword (*gladius* in Latin).

Type Material: A.E. Fersman Mineralogical Museum, Moscow, Russia (2310/1), and in the Geological Museum, Institute of Geosciences, University of Oulu, Finland (12182).
